

BRAIN INJURY OUTCOME DATA REPORT 2017

Outcome comparison between Riverside Rehabilitation Hospital and other rehabilitation hospitals in the nation

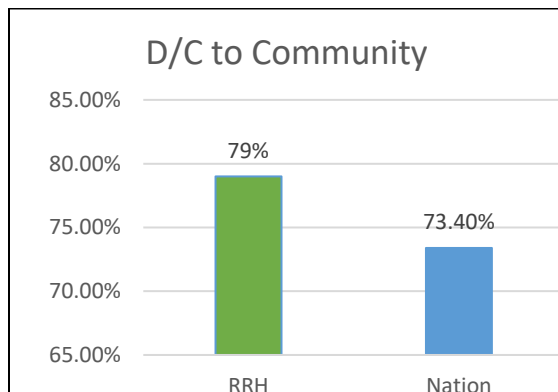

(This includes both traumatic and non-traumatic brain injuries)

86 brain injury patients were treated in 2017

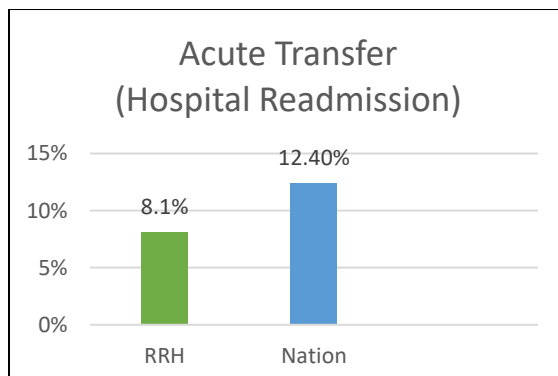

Compared to the nation, we admitted BI patients almost 4 days sooner.

Collaboration with case managers and attendance at RRM Neuro and trauma IPOC rounds have assisted in identifying potential rehab candidates sooner

79% of our BI patients were able to make enough progress during their short rehab stay (average 14 days) and return to their prior living arrangements, while continuing their rehab with outpatient or home health therapy.

Only 8% of our BI patients were sent back to the hospital for acute medical reasons during their inpatient rehab stay.
